

## Create your WEB Application with MVC paradigm and OPP – PAP support Tutorial 13

Now, let's define the products database for your project. But if you repair, we need also to create a category database, because the products have categories inside as a FK (foreign key).

In mine case I will use the follow example:

Ok, when you define you example, go to your database and start to add the new tables, like the example:

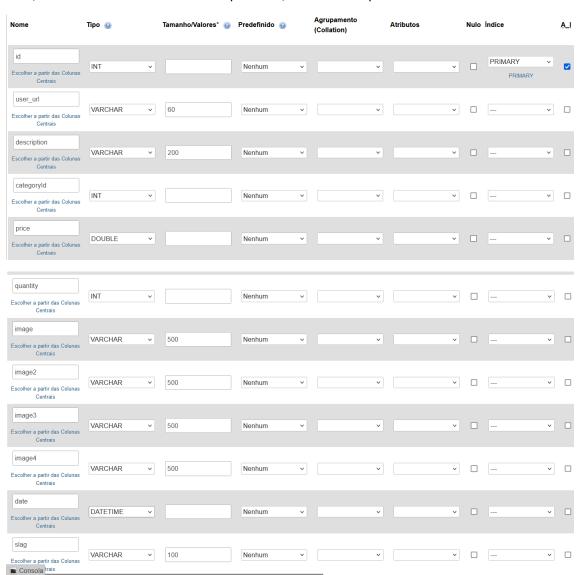

## Result:

Don't forget to select in options of the field categoreis, the index, to able in the future the search for the name categories.

Now, let's contruct the the new table products, like the example before:~

## And the result are:

Like the table before, don't forget to identify the indexes (mais -> indice), in the fields where

Okay, if you see, you have some normal fields, but you have a special field with the name 'slag'. This is for Google indexing. When someone makes a search, the URL will have the words from the product title, in that way, the search engine, like Google, will index the site more easily. Will work as the 'user\_url' to identify the user.
